Employee Management Application

Abstract:

This project, titled "Employee Management Application," is designed to facilitate the management of employee records within an organization using modern web technologies. The application leverages Spring Boot as the backend framework, integrated with Java Persistence API (JPA) for managing the data model. The frontend is developed using HTML, CSS, and JS alongside the template engine, ensuring a seamless user experience. The system is built to interact with a MySQL database, depending on the configuration, to store and retrieve employee data.

Key functionalities include creating, reading, updating, and deleting employee records, with validation and error handling implemented at both the backend and frontend levels. The project also includes detailed documentation for setting up, configuring, and running the application, with **Swagger** integration for API documentation. This ensures that the application is not only functional but also well-documented for ease of use and future development.

- **1. Project Overview Project Title:** Building an Employee Management Application with Spring Boot ,HTML, CSS, and JS Framework.
 - **Description:** This project is aimed at developing a full-fledged employee management system with a Spring Boot backend and a Thymeleaf-based frontend. The application allows users to perform CRUD (Create, Read, Update, Delete) operations on employee data. It features robust backend development using Spring Boot and JPA for database interactions, and a user-friendly frontend developed with HTML, CSS, JavaScript.

2. Prerequisites:

Before starting the project, ensure you have the following software installed:

- Java Development Kit (JDK) 11 or higher
- Apache Maven 3.6+
- MySQL
- Integrated Development Environment (IDE): Eclipse, Spring Tool Suite (STS) Git (optional, for version control)
- Postman or Command Prompt.

3. Project Setup

3.1 Clone the Repository

To begin, clone the project repository to your local machine:

git clone <repository-url> cd employee-management-app

3.2 Database Setup You can choose either MySQL as your database. Configure the application.properties file to set up the database connection.

• MySQL Configuration:

spring.datasource.url=jdbc:mysql://localhost:3306/user_db_emp1 spring.datasource.username=root spring.datasource.password=Root spring.jpa.hibernate.ddl-auto=update spring.jpa.show-sql=true

3.3 Build and Run the Project

Build the project using Maven:

• mvn clean install

After successfully building the project, run it using:

• mvn spring-boot:run

3.4.pom.xml on added:

- O Lombok
- O Spring web
- O Spring Data JPA
- O Spring boot DevTools
- O MySQL Driven
- **O** Thymeleaf

O Validation

The application will be accessible at http://localhost:8080.

4. Backend Development (Spring Boot and JPA)

4.1 JPA Entity and Data Model

The application uses JPA for database interactions. Below is an example of the User entity: Sample coding:

User.java

4.2 RESTful API Implementation

The backend provides RESTful APIs to handle JPA operations on employee data.

UserController:

```

### Decided Feature | Decided | Deci
```

6.Database and Data Model

6.1 MySQL Setup Set up the database depending on your preference. Use the following commands to create the database:

• MySQL:

CREATE DATABASE user_db_emp1;

TABLE NAME: users.

6.2 JPA Entity Mapping

Map the Employee entity to the database using JPA annotations.

Example Mapping for MySQL:

@Entity

@Table(name = "users")

Using private modifier ,data type String.and getter and setters.....

7. API Documentation

7.1 Swagger Integration

Swagger is integrated into the project for API documentation. Add the Swagger dependency in your pom.xml:

Accessing Swagger UI: After starting the application, Swagger UI is accessible at

http://localhost:8080/swagger-ui/.

7.2 API Endpoints Documentation

• Create Employee: Method: POST

```
URL: /api/users
```

O Request Body:

```
"UserFirstName": "Harini",

"UserLastName": "Ravi", "UserEmailId":

"harini@test.com",
```

- Get Employee by ID:
- Method: GET
- **URL:** /api/users/{id}
- Update Employee:
- Method: PUT
- **URL:** /api/users/{id}

• Request Body: Same as create employee

• Delete Employee:

• **Method:** DELETE

• **URL:** /api/users/{id}

8. Deployment

10.1 Packaging the Application

Package the application into a JAR file using Maven:

O Mvn clean package

10.2 Deploying to a Server

9. Conclusion

This documentation provides a comprehensive guide to setting up, developing and deploying the Employee Management Application. It covers all aspects of the application, including backend and frontend development, database configuration, API documentation, validation, error handling, and testing. By following this documentation, developers can easily set up and run the application while ensuring that all required functionalities are properly implemented.
